Engineer specializing in agentic AI systems and the tooling that makes engineering teams AI-native, built on a decade of scaling high-throughput distributed systems. Technical lead of a production LLM agent platform: multi-agent architecture, Model Context Protocol tooling, LLM observability and evals, and AI-powered developer workflows adopted across an organization.

Gusto

Software Engineer

August 2023 — Present | Volcano, HI

- Technical lead for Otto, Gusto's production AI support agent. Led its end-to-end migration to a LangGraph-based multi-agent framework — building the agent runtime, tool registry, and streaming chat service — shipping across 7 repositories from Terraform to Rails backend to React frontend (116 PRs authored, 103 reviewed in a single quarter).
- Otto-assisted support cases close at 98.58% versus a 95.44% baseline, with 88.3% of weekly active support advocates reaching the proficiency threshold.
- Built role-aware Model Context Protocol (MCP) tools and Otto's MCP authorization server; authored the "Otto Tools" guide that established the group-wide standard for building MCP tools.
- Built an AI-powered engineering workflow suite: a plan-lifecycle plugin taking work from idea to implemented PR with AI orchestration at every step, an AI code review plugin with an adversarial review mode, and sprint ceremony automation the team now runs every sprint — 48 PRs to the internal plugin marketplace in one quarter, with teammates independently adopting the workflows.
- Shipped org-wide LLM-powered code review enforcement for protected files, migrating it from OpenAI to AWS Bedrock and adding per-rule shadow mode and structured logging.
- Built a containerized simulation environment for Otto that reproduces any company/user/session combination outside Salesforce — unblocking development and enabling isolated UI testing of the agent.
- Delivered production reliability for an LLM product: SLOs defined in Terraform, Real User Monitoring, chat stream lifecycle metrics, and session continuity preserving conversation context across long-lived email and phone threads.
- Authored the cross-channel agent coordination technical vision (Journey Protocol) and championed it from concept to prioritization as the foundation for multi-agent coordination across support channels.
- Resolved Salesforce iframe embedding blockers (X-Frame-Options, SameSite/Secure cookies, Chrome Local Network Access) in partnership with Security; drove remediations including encryption key rotation, typeahead PII protection, and GraphQL superuser access controls.
- Independently assessed at the top tier of AI engineering fluency (21/21, Advanced across all seven dimensions): 1,746 Claude Code sessions and 165,000+ messages in a single quarter across 31 repositories.
- DRI for the Payroll Activity Tool, an internal product used by non-engineering support teams: closed 31 of 68 project tickets; reached 1,771 uses by 276 internal users with 61% returning for a second use.
- DRI for Panda Tags, bringing prioritization and consistency to 500+ tags in Gusto's internal admin tool; wrote a RuboCop rule to enforce the new system and mentored an engineer through the implementation.
- Mentored engineers through pairing and design reviews, revamped the team's sprint process, and took over a teammate's customer-authentication project during their medical leave to keep it on track.

Cortex

Software Engineer

February 2022 — March 2023 | Volcano, HI

- Led cross-functional teams in the planning, implementation, and deployment of multiple product features.
- Extended the microservice catalog to support all infrastructure resource types, including databases and blob storage.
- Eliminated up to 99% of query overhead by identifying and optimizing inefficient patterns generated by Hibernate.
- Streamlined customer workflows by implementing automatic synchronization between Cortex initiatives and Jira.

X Delivery

Software Engineer

September 2020 — December 2021 | Volcano, HI

- Technical lead and manager of the entire engineering and product organization, including IT; participated in executive planning.
- Designed and implemented a Python ETL framework for complex data pipelines spanning Athena, SFTP, MongoDB, S3, Redshift, and others.
- Built a high-performance parcel tracking ingestion system processing tens of millions of events per month, powering the consumer-facing tracking page and webhook delivery to third-party partners.
- Scaled the core API (Node.js & MongoDB) through 1,000%+ year-over-year growth; migrated from EC2 to Elastic Beanstalk and MongoDB Atlas.
- Implemented structured logging and observability with Logz.IO, building dashboards for proactive outage detection and resolution.
- Led SOC II gap analysis and remediation.
- Open-source contributions to `sqlalchemy-reshift`, `nock`, and `luxon-business-days`.

EasyPost

VP of Product

February 2020 — August 2020 | San Francisco, CA

- Member of the executive team; built and owned the long-term product roadmap.
- Implemented Agile Scrum across engineering and product, improving timeline accuracy and stakeholder communication.
- Product owner for the Infrastructure and US Carriers teams; key deliverables include application sharding and UPS Digital Access Program.
- Established an OKR cadence for the PM organization to drive metrics-based goal-setting and career development.

Director of Product

December 2018 — February 2020 | San Francisco, CA

- Founding member of the Product Management organization at EasyPost.
- Built scalable processes for customer escalation management, feature requests, and vendor reviews.
- Recruited and developed a team of 10+ product managers and designers, including mentorship programs and training initiatives.

Software Engineer

January 2018 — December 2018 | San Francisco, CA

- Day-to-day operator of the Engineering team; head of technical support and lead application developer.
- Built the first versions of the warehouse management, order management, and transportation management systems; deployed across four warehouses shipping hundreds of thousands of packages per month.
- Scaled the shipping API to support tens of millions of labels and hundreds of millions of inbound and outbound requests per month.
- Hired and managed, directly or indirectly, several dozen engineers.

Software Engineer

February 2014 — January 2018 | San Francisco, CA

- Application developer focused on infrastructure: service-oriented architecture, message queues, testing, and software design.
- Introduced and scaled `beanstalkd`, a message queue processing hundreds of millions of jobs per month; contributed to related open-source projects.
- Deployed EasyPost's first microservice; the fleet grew to over 200.
- Built ELK-based observability infrastructure processing hundreds of millions of requests per day, with thousands of distinct time series metrics.
- Guided the architectural transition from monolith to microservices.

Yelp

Software Engineer

January 2012 — January 2014 | San Francisco, CA

- Led design and implementation of a generic data ingestion platform from inception through production maintenance.
- Enabled Yelp's acquisition of Qype by ingesting all company and review data.
- Enabled partnerships with menu data providers to surface menu data on Yelp business pages.
- Built Apple Maps integration using differential data dumps of businesses and reviews via Elastic MapReduce.

University of Pittsburgh

BS, Computer Science
